Sentry Shed Build Instructions

Please ensure that you build the shed on a flat, hard and stable surface.

It is possible for one person to build the shed, but a 2nd helper to hold panels whilst in construction would make the job much easier.

As you are building the shed, do not tighten the screws fully until the end, Make sure that you do not over tighten screws. Make sure that all panels are square and at 90 degrees where appropriate and that the shed is level before tightening all the screws.

1. Attach the adjustable feet to the bottom of the side panels
2. Fix the back panel to the side panels making sure that the screws are sited in the pre-drilled holes
3. Fix the handle to the door first, then fix the door to the side panel. Make sure that you site the screws in the pre-drilled holes
4. Attach the front top roof panel as per diagram 4 using the pre drilled holes through the side panel
5. Attach the back top roof panel as per diagram 5 using the pre drilled holes through the side panel
6. Fix the roof panels using the pre drilled holes and screwing through from the inside of the shed
7. Attach the central roof fillet (do not over tighten this piece) and front finial.
8. Lastly place the base board in the shed and all shelves, Make sure you level the shed and then tighten screws all round. Do not over tighten screws.
